## WHAT IS LASIK ?

LASIK is the most commonly performed laser eye surgery to treat myopia (nearsightedness), hyperopia (farsightedness) and astigmatism.

The word "LASIK" is an acronym for "laser-assisted in situ keratomileusis."

Like other types of refractive surgery, the LASIK procedure reshapes the cornea to enable light entering the eye to be properly focused onto the retina for clearer vision.

LASIK surgery is essentially pain-free and takes only about 10 minutes for both eyes. The results — improved vision without eyeglasses or contact lenses — begin immediately after the procedure and vision usually continues to improve and stabilize over a few days.

## ULTRA LASIK Advanced

The gold standard for LASIK Surgery, Ultra LASIK offers the fastest healing and recovery. It is highly recommended for patients with thin cornea, and high degree of astigmatism and eye grade.

## Z PRIME LASIK Pro

It produces the smoothest possible flap profile with even, clean edges regardless of the shape and size of the eye.

## 5 YEARS ENHANCEMENT LASIK WARRANTY

Shinagawa Lasik Center offers a comprehensive 5-year enhancement warranty of our laser eye surgery services that applies either in our clinics in the Philippines or Japan.

*The SCHWIND AMARIS 1050RS is one of the world's highest-performance eye laser systems for refractive and therapeutic corneal surgery, and is only available in Shinagawa Clinics in the Philippines.*

## OTHER VISION CORRECTION PROCEDURES

### RLE (Refractive Lens Exchange)

RLE is designed for patients who have insufficient power in their natural lenses as it enables a clearer vision minus the need for visual aids. It is bound to replace a clear lens opposed to Cataract Surgery, which replaces a cloudy lens.

### IMPLANTABLE CONTACT LENS (ICL)

Implantable contact lens or (ICL) is an alternative procedure for patients who are not qualified for LASIK. This treatment is also called a "permanent contact lens" since it does not require daily care and removal.

### CORNEAL COLLAGEN CROSS LINKING

It is usually done in combination with any LASIK procedure to biomechanically strengthen thin corneas for a greater and lasting stability of vision over time.

### THIN FLAP LASIK

This is also done in combination with any LASIK procedure. The Advantage of Thin Flap Lasik Procedure is that it provides faster visual performance recovery to patients.

## FREQUENTLY ASKED QUESTIONS:

### *What is the minimum age requirement for LASIK?*

You need to be at least 18 years of age to have LASIK surgery. This is to make sure that your refractive error - the amount of nearsightedness, farsightedness and/or astigmatism you have is stable and unlikely to worsen after your LASIK surgery.

### *Is it painful?*

**No.** The actual treatment is painless. Aesthetic drops will completely numb your eye. You may just feel a light pressure sensation around your eye. You may also be given a prescription for a pain reliever should you need it.

### *How long does the LASIK procedure take?*

The procedure usually takes around 10 minutes for both eyes. Depending on your prescription and needed correction, the laser itself only takes 20-50 seconds to correct your vision.

### *How long will the effect of LASIK last?*

Generally, the correction is permanent, especially if your eyeglass prescription was stable before you had LASIK. Shinagawa offers a 5-year LASIK warranty should there be any changes in the correction.

### *Is LASIK a safe procedure?*

With laser vision correction surgery, a patient will have a secured procedure with no expected complications. At Shinagawa LASIK and Aesthetics, we have the most advanced laser technology in the industry, making it the safest possible procedure.

Proven and tested as a safe procedure, LASIK is one of the most reliable surgeries. It is bladeless and painless with only mild eye pressure felt. LASIK presents a fast recovery period, too.
